Mohamed Landolsi

GTM Automation & Integration Engineer

+216 96 857 929 | Nabeul, Tunisia (UTC+1) | Open to Remote B2B Contracts & Relocation | mohamedlandolsi300@gmail.com | github.com/mohamedlandolsi | linkedin.com/in/mohamedlandolsi | mohamedlandolsi.tech

Software engineer turned GTM automation builder. I design B2B outbound and enrichment systems in n8n, Clay and custom APIs where rules screen data before any LLM or paid call, every model call has a fallback, credits are metered, and a person approves anything that leaves.

Skills

- **GTM Automation & Integration**: n8n, Clay (Email Waterfall, AI Research, Public API), Webhooks, REST APIs, Apify, Tavily, Google Sheets
- **AI Workflows**: LLM Routing & Fallback Chains, Structured JSON Output, Output Validation, RAG Pipelines, pgvector, AI-Assisted Development (Claude Code, n8n MCP)
- **Engineering & Delivery**: Python, FastAPI, JavaScript, React, Next.js, SQL, PostgreSQL, Supabase, Docker, Fly.io, Git, Postman, Jira

Work Experience

Software Engineering Intern (Architecture & Full-Stack) 12/2025 to 05/2026

Wavess (B2B SaaS startup) *Berlin, Germany (Remote)*

- Architected a service-oriented GTM platform (identity portal, LinkedIn content service, GTM intelligence engine, shared core library) for 6 B2B clients in Germany, the UK and Czechia, and deployed it on Fly.io.
- Built async enrichment pipelines integrating Apify and Tavily APIs in ARQ/Redis background workers, feeding an LLM-based ICP scoring engine that ranks and prioritizes target accounts.
- Built the shared LLM router used by every service: 6 model routes across 4 providers (Groq, Cerebras, Gemini, NVIDIA NIM), switching routes at 95% of each provider's daily free quota.
- Modeled as-is and to-be GTM workflows in BPMN to decide which manual steps to automate, and traced 57 requirements to user stories across 6 sprints.

Key Projects

Personal GTM Engine | n8n + Clay Outbound Discovery, Enrichment & Drafting 09/2026 to Present

- Built 3 n8n workflows that source B2B startups from the YC directory, Hacker News hiring threads and a seed list, with rule-based gates before any LLM or paid call (377 YC companies cut to 23 in one run).
- Integrated Clay as the enrichment layer: one structured AI research column per account cut cost from 2.8 to 1 credit per row across 22 accounts, with n8n logging credit balances via Clay's API around each batch.
- Ran a Clay Work Email waterfall with conservative validation on one primary founder per qualified account, finding verified emails for 19 of 20 founders (95%) at about 0.5 credits each.
- Drafted LinkedIn notes, messages and follow-ups via a Groq → Gemini fallback chain with a rule-based validator; each draft goes to a Discord review card, 0 sent without approval. Documented 66 architecture decisions.

Job Radar | n8n Job-Intelligence Pipeline 09/2026

- Deployed a daily n8n pipeline (Docker on a GCP Always Free VM) merging 466 to 617 postings per run from 11 sources (REST APIs, RSS), with deduplication and config-driven hard filters.
- Scored at most 15 postings per run through a Groq → Gemini fallback chain with per-source error isolation (24/24 scored during a provider outage), plus Discord digests and per-run telemetry, at $0 cost.

Additional Experience

- **AI Engineer Intern**, AYCORP Technologies (06/2025 to 08/2025): Prototyped a voice interview pipeline integrating VAPI with Gemini 2.5 Flash in a Next.js app and defined its API contracts.
- **Full-Stack Developer (Volunteer)**, Stade Nabeulien Rugby Club (06/2025 to 09/2025): Replaced manual scheduling and attendance tracking with a Next.js web app, saving staff about 3 hours/week.

Education & Languages

Software Engineering Degree (Master's Equivalent), IT Business School (ITBS) | 2023 to 2026
Bachelor's Degree in Information Technology, ISET Nabeul | 2020 to 2023
Languages: English (Professional), French (Reading & Listening), Arabic (Native)
